# Agenda

- Introduction/Current Status
- Our Approach
- Examples
- Open Challenges
- Conclusions

# Our Goal

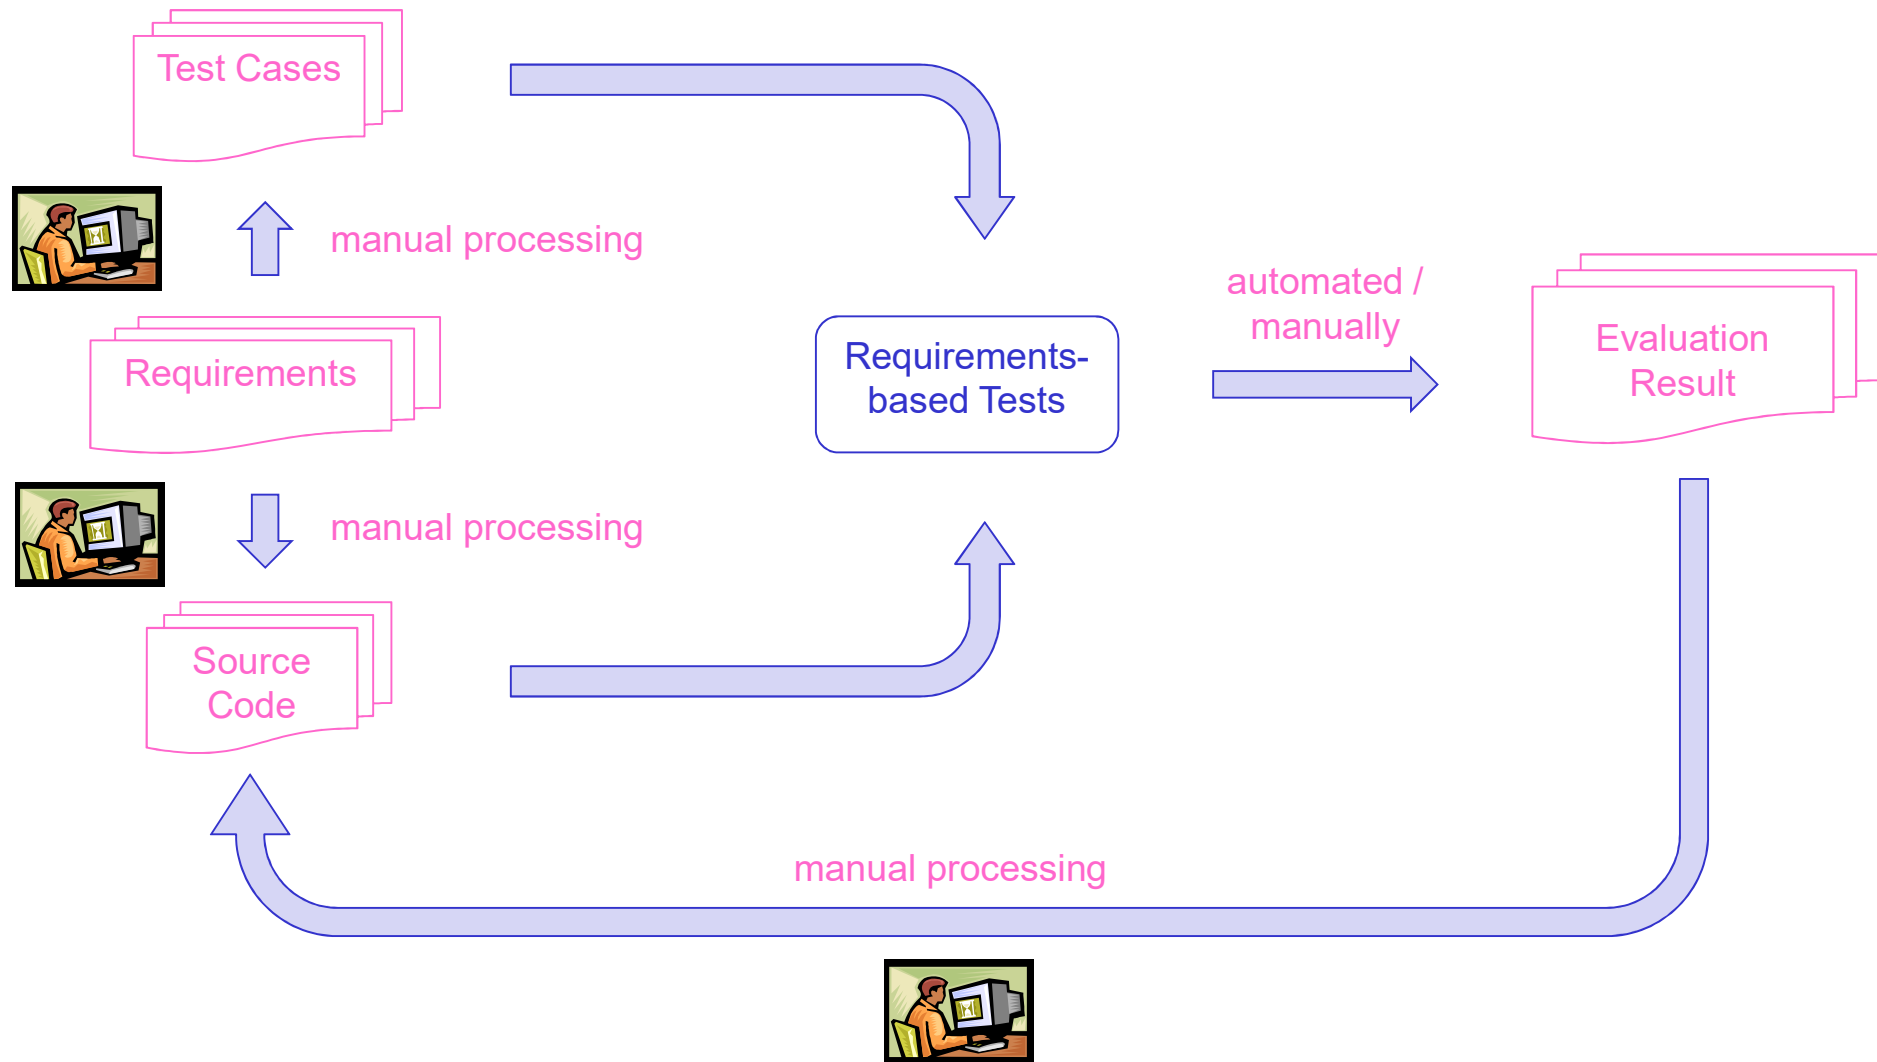

# Current Status

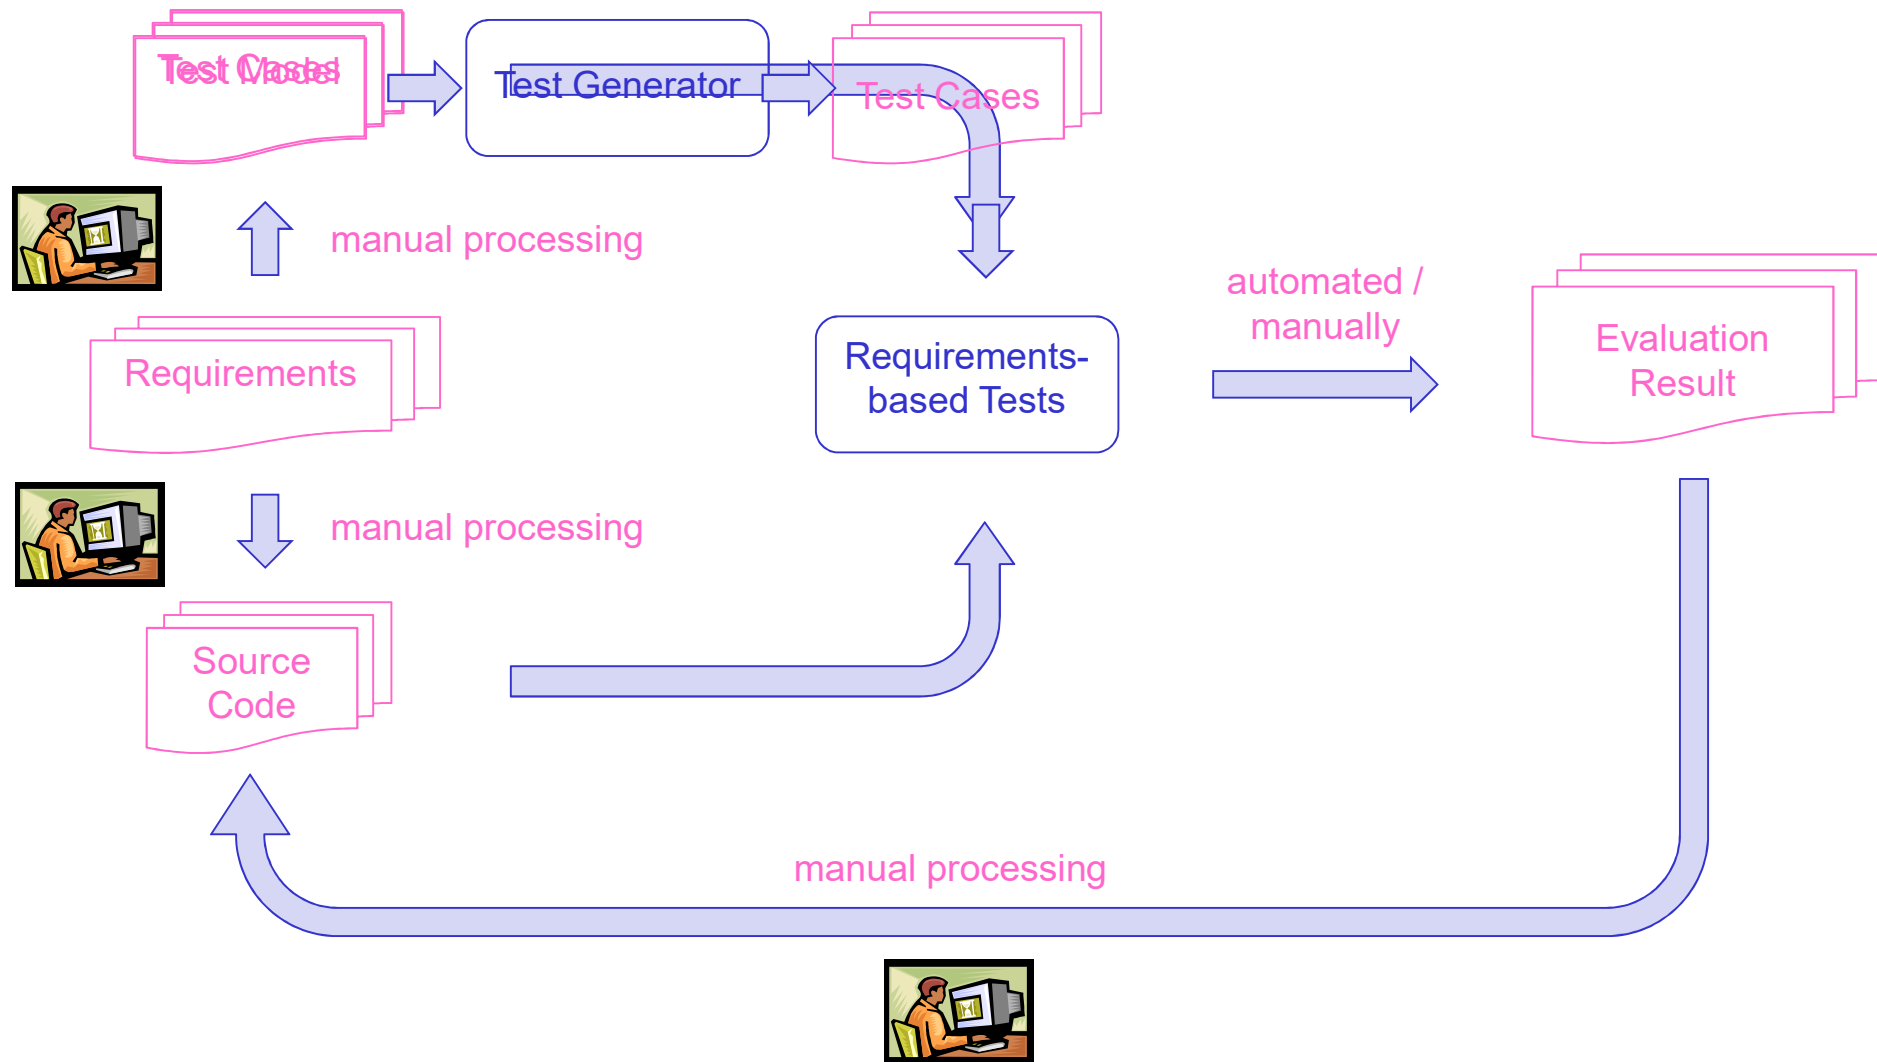

# Goal for Automation of RQBT

- Benefitting from automated massive stimulation
- Automated correlation of unit tests with requirements
- Automated evaluation of test results w.r.t. requirements
- Automated propagation of verification results (pass/fail) bottom-up in the hierarchy of requirements

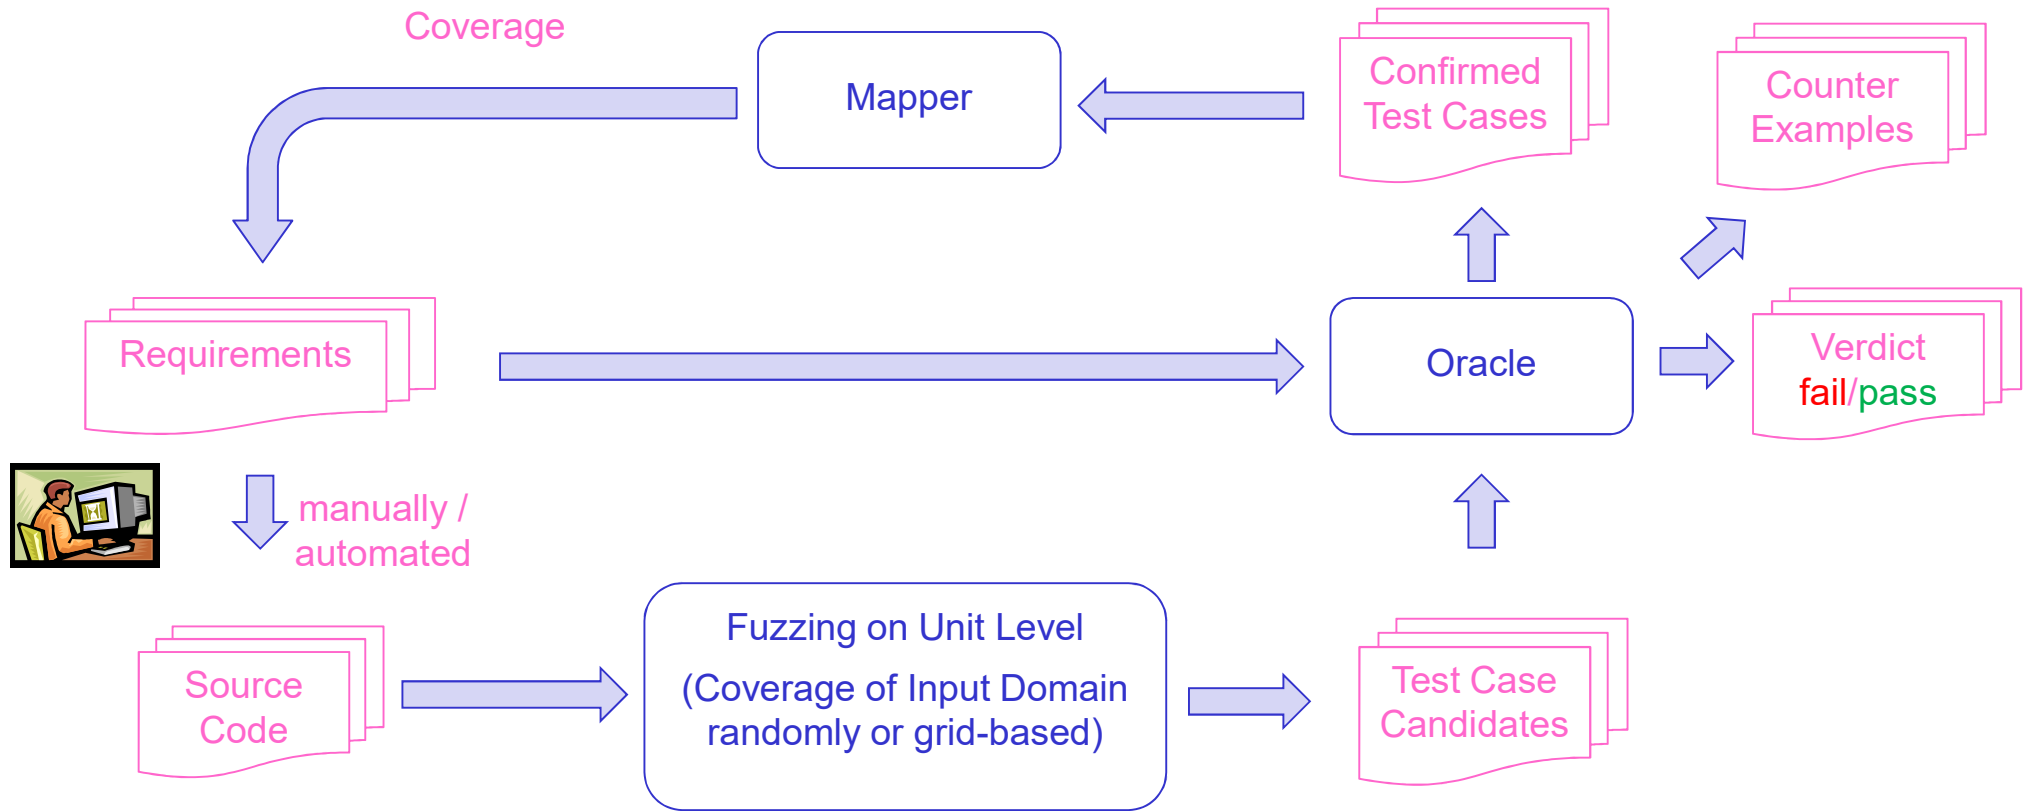

# The Manual Procedure for RQBT

# Model-Based Testing

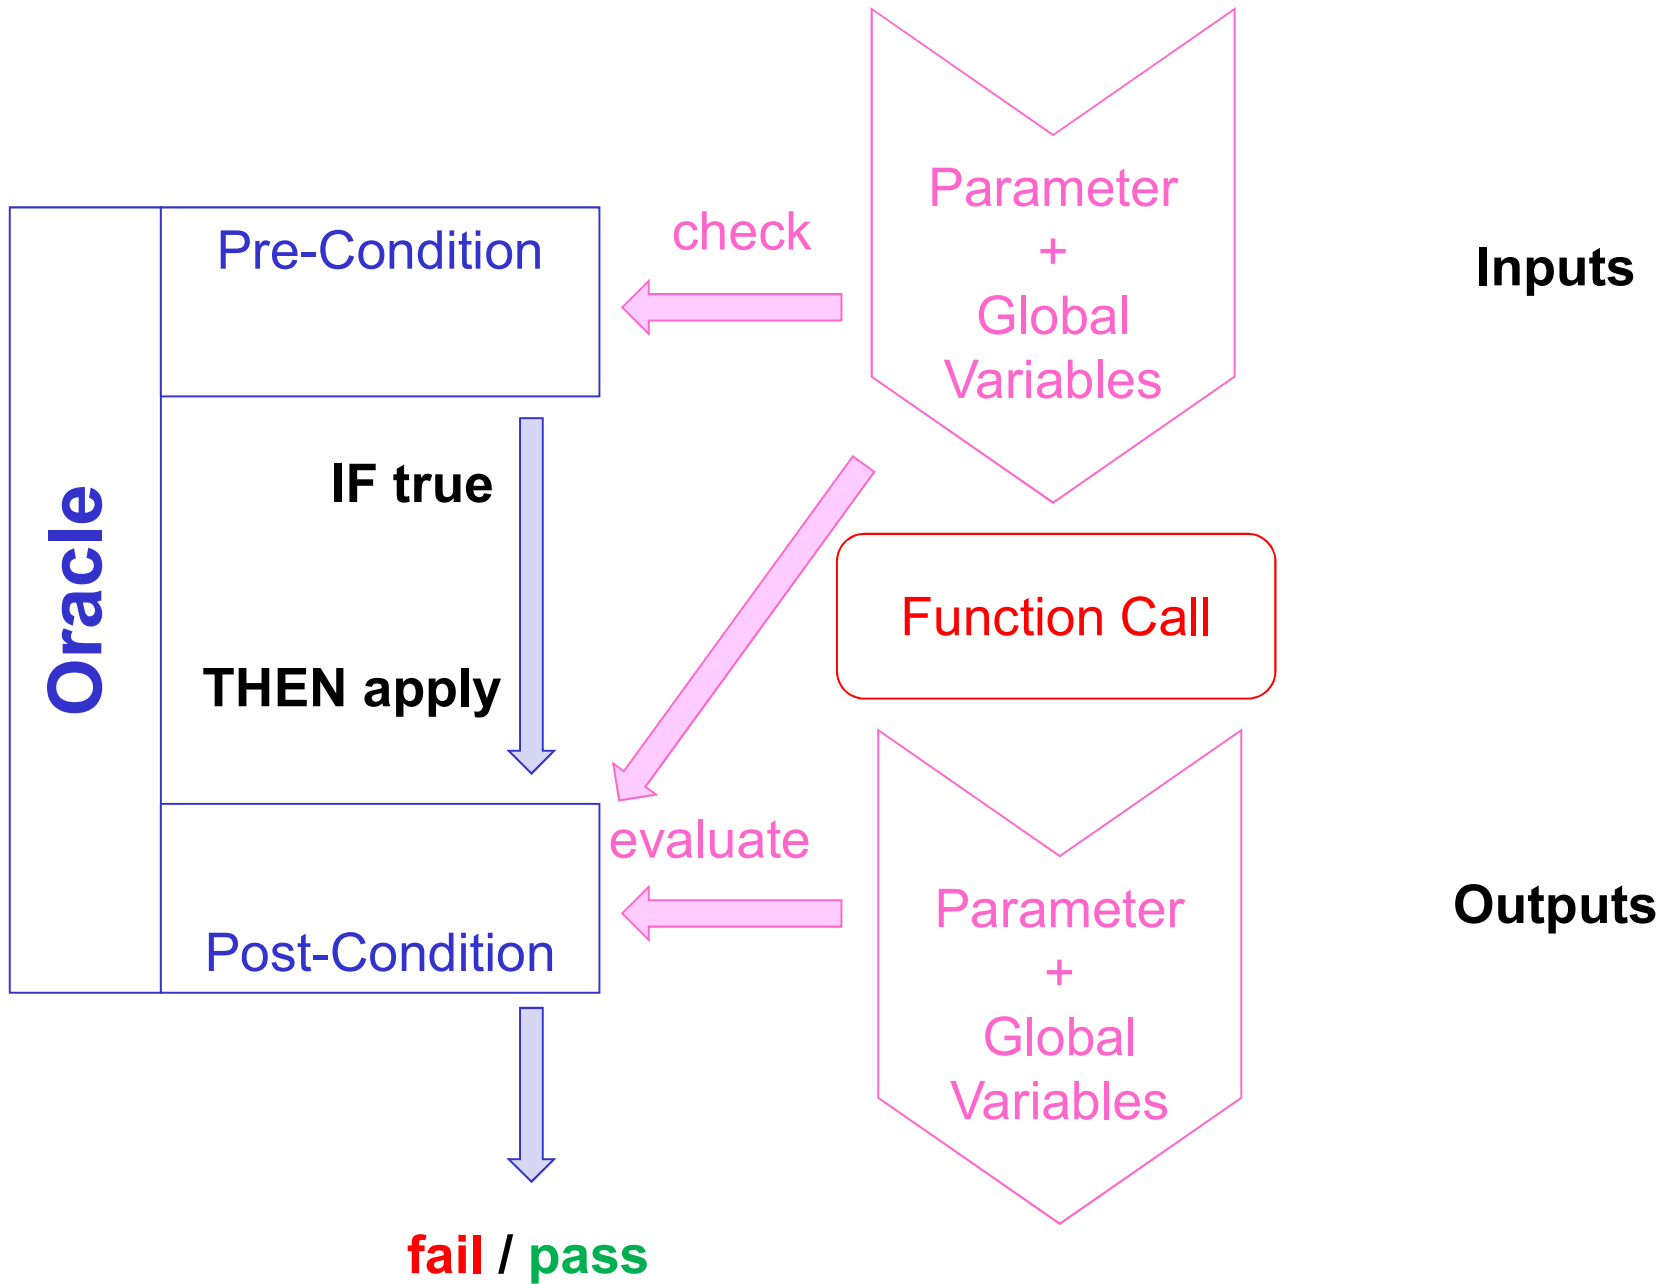

# Our Approach

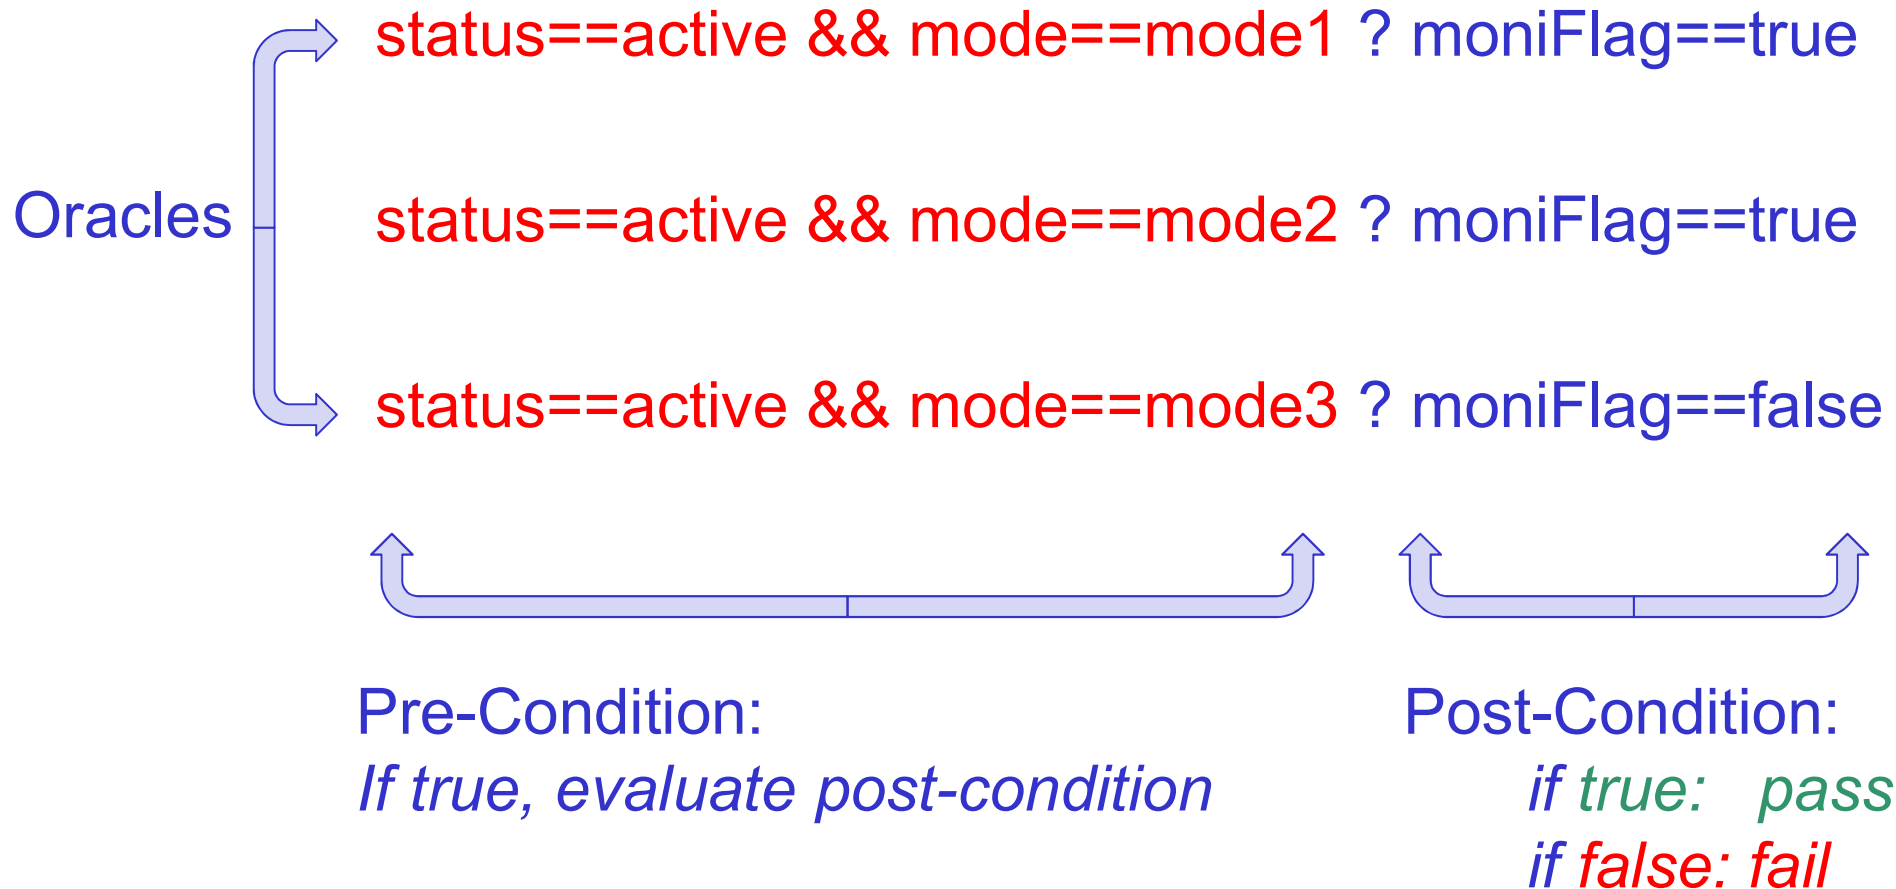

# Oracle Structure

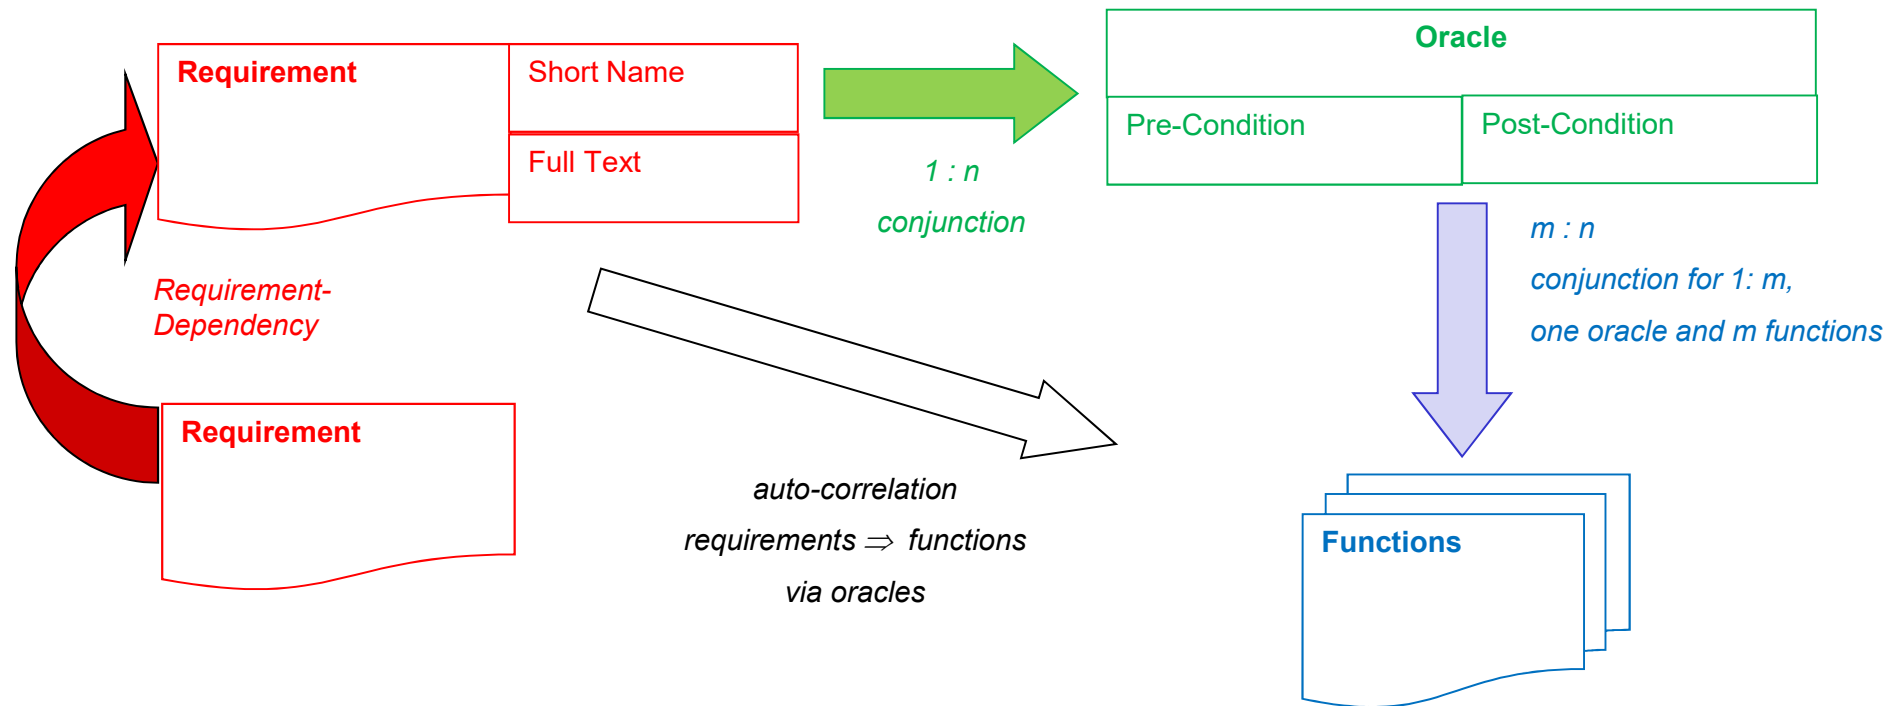

# Example: Status Monitoring

# Some Mathematical Examples and Results of Implementation

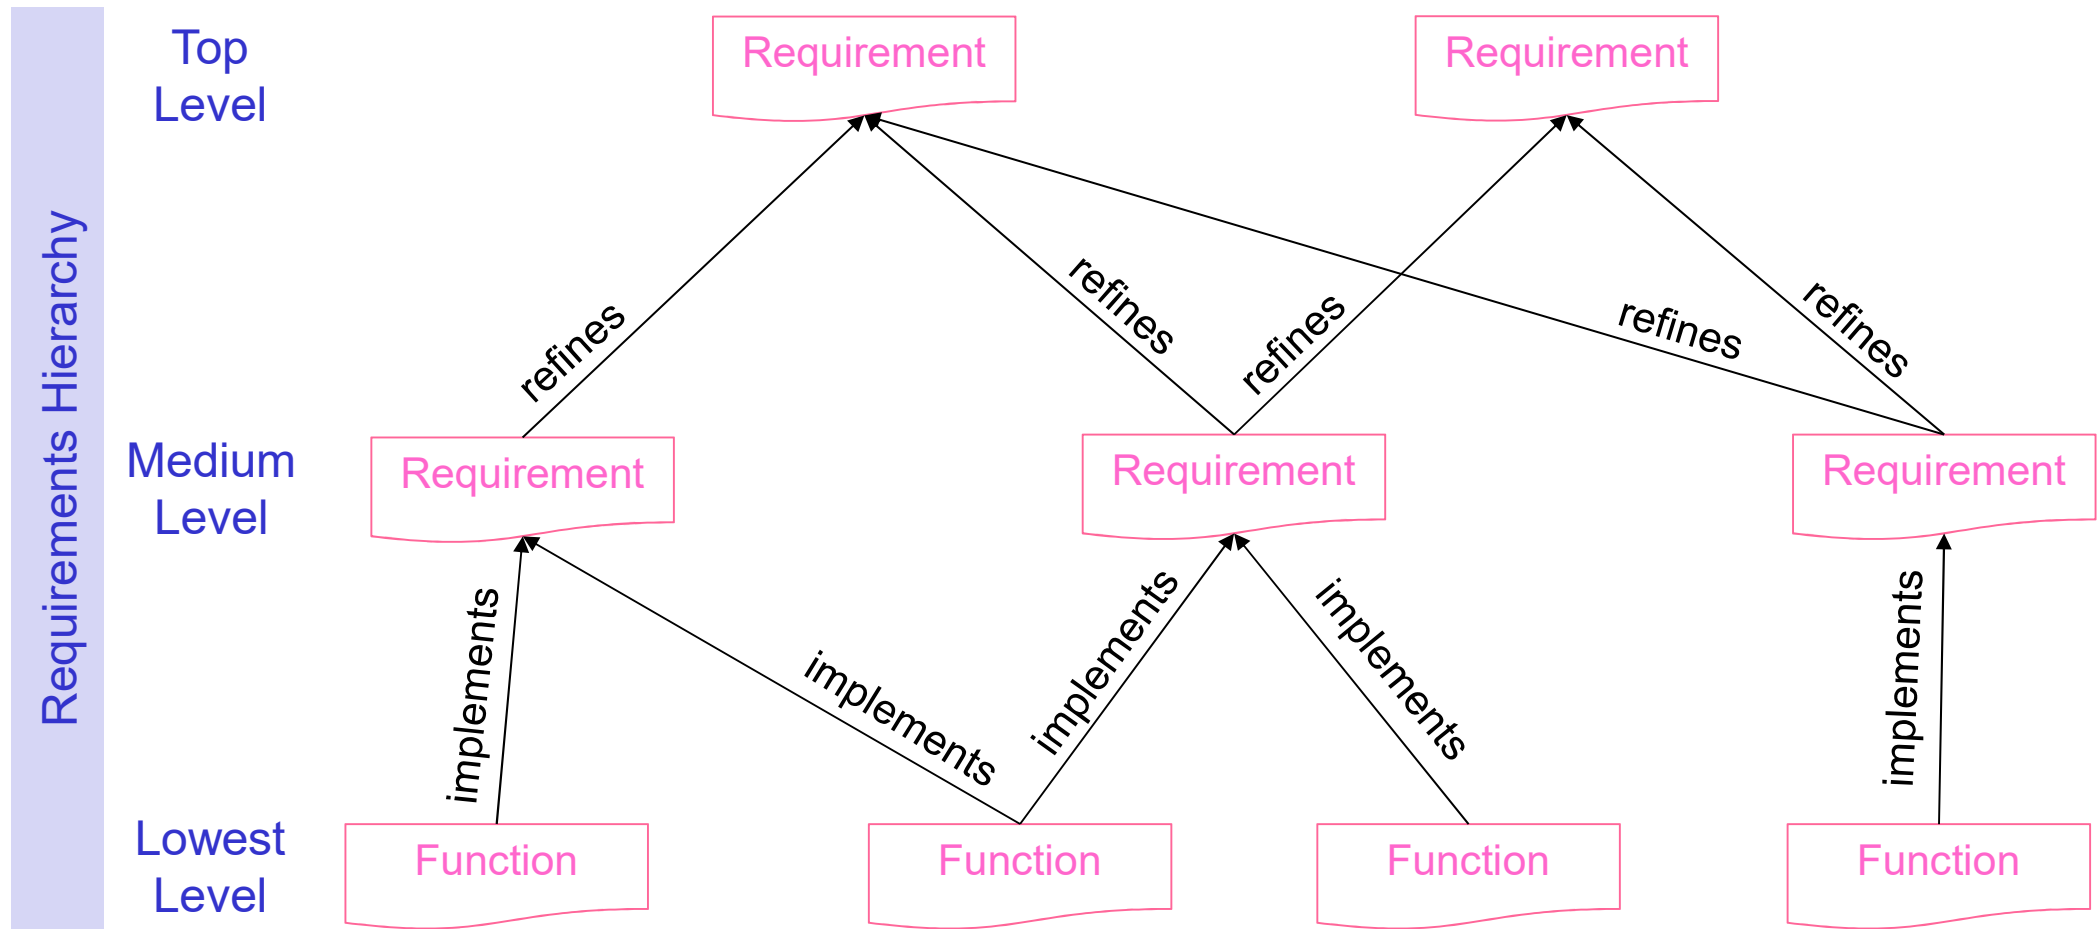

Function	Requirement	Oracle		Number of Tests	Oracle Output			RQ fully covered	RQ verified
		Pre-Condition	Post-Condition		Coverage	true	false		
x*x	$\forall x \in \{\text{double}\} \sqrt{x^2}$ shall not differ from $ x $ more than $\epsilon$	x normalised	$(\text{fabs}(\text{fabs}(x) - \text{sqrt}(\text{retVal})) / x) < \text{eps}$	302	299	225	74	yes	no
		x denormalised	$\text{fabs}(\text{fabs}(x) - \text{sqrt}(\text{retVal})) < \text{eps}$		3	3	0		
abs(x)	$\forall x \in \{\text{int}\} \text{abs}(x)$ shall be $\geq 0$	true	$\text{retVal} \geq 0$	302	302	301	1	yes	no

# Mapping Scheme

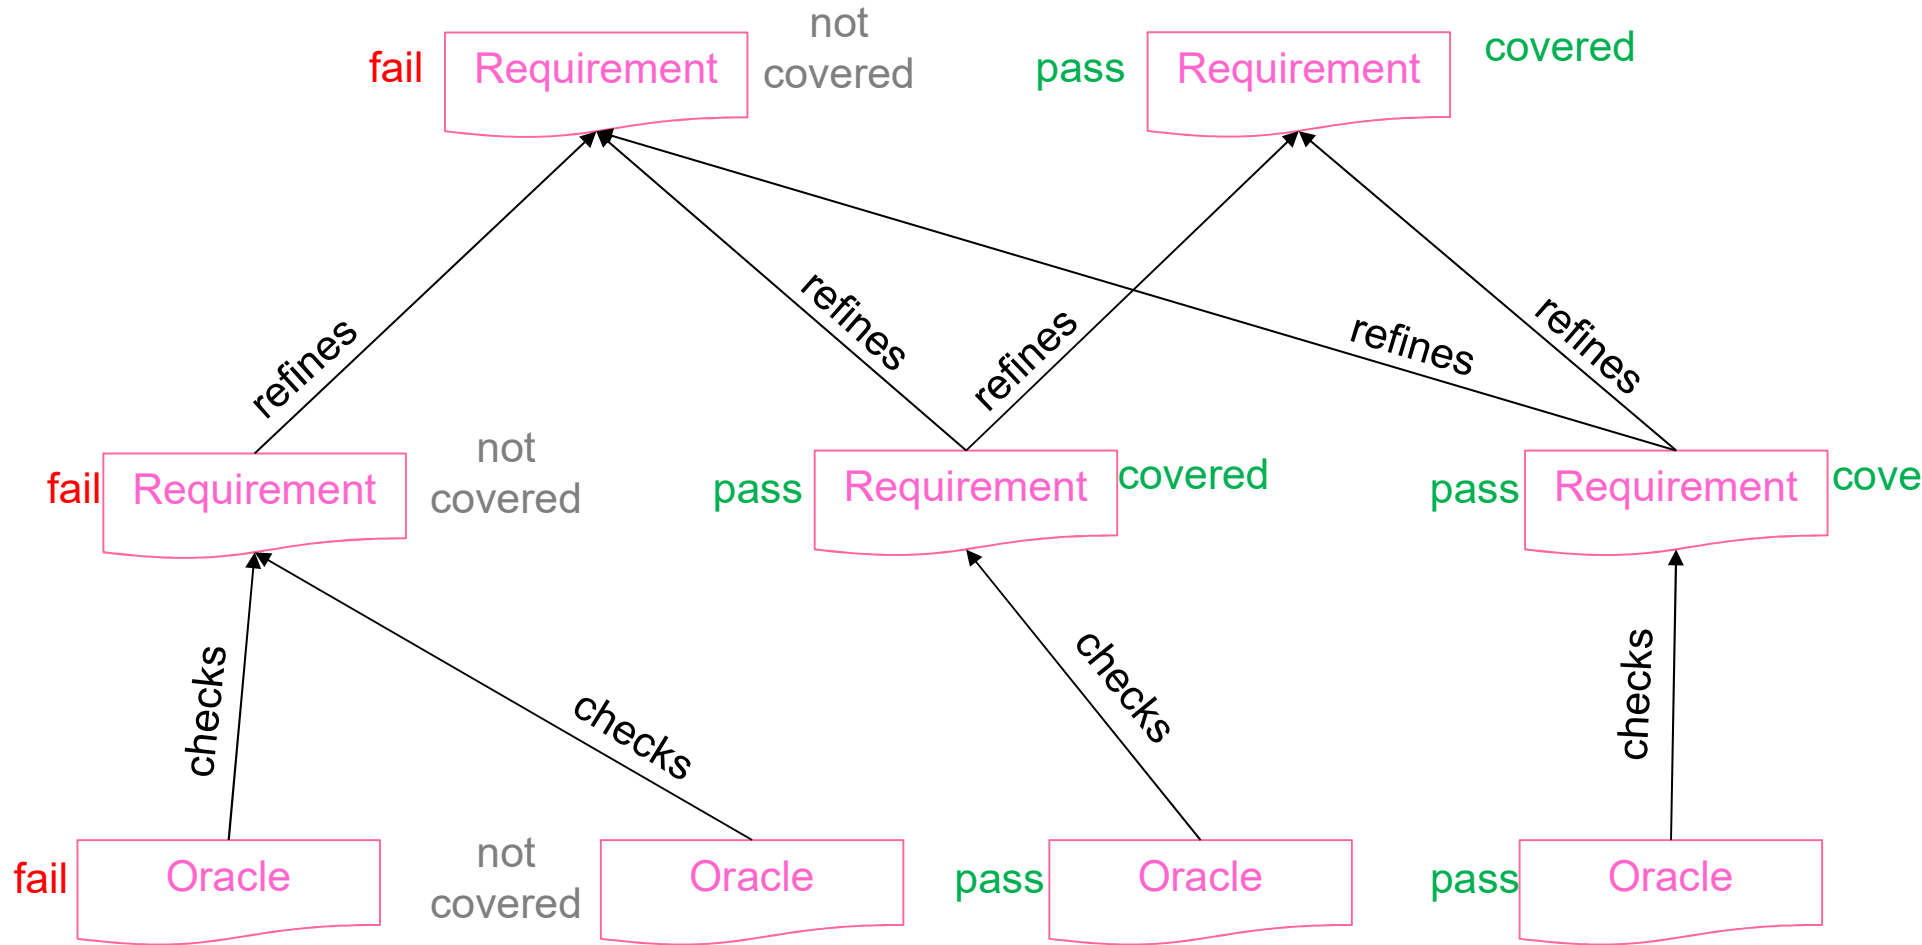

*Goal / Challenge:  
 automated derivation  
 supported by some  
 formalised (an)notation  
 of requirements*

# Functions vs. Requirements

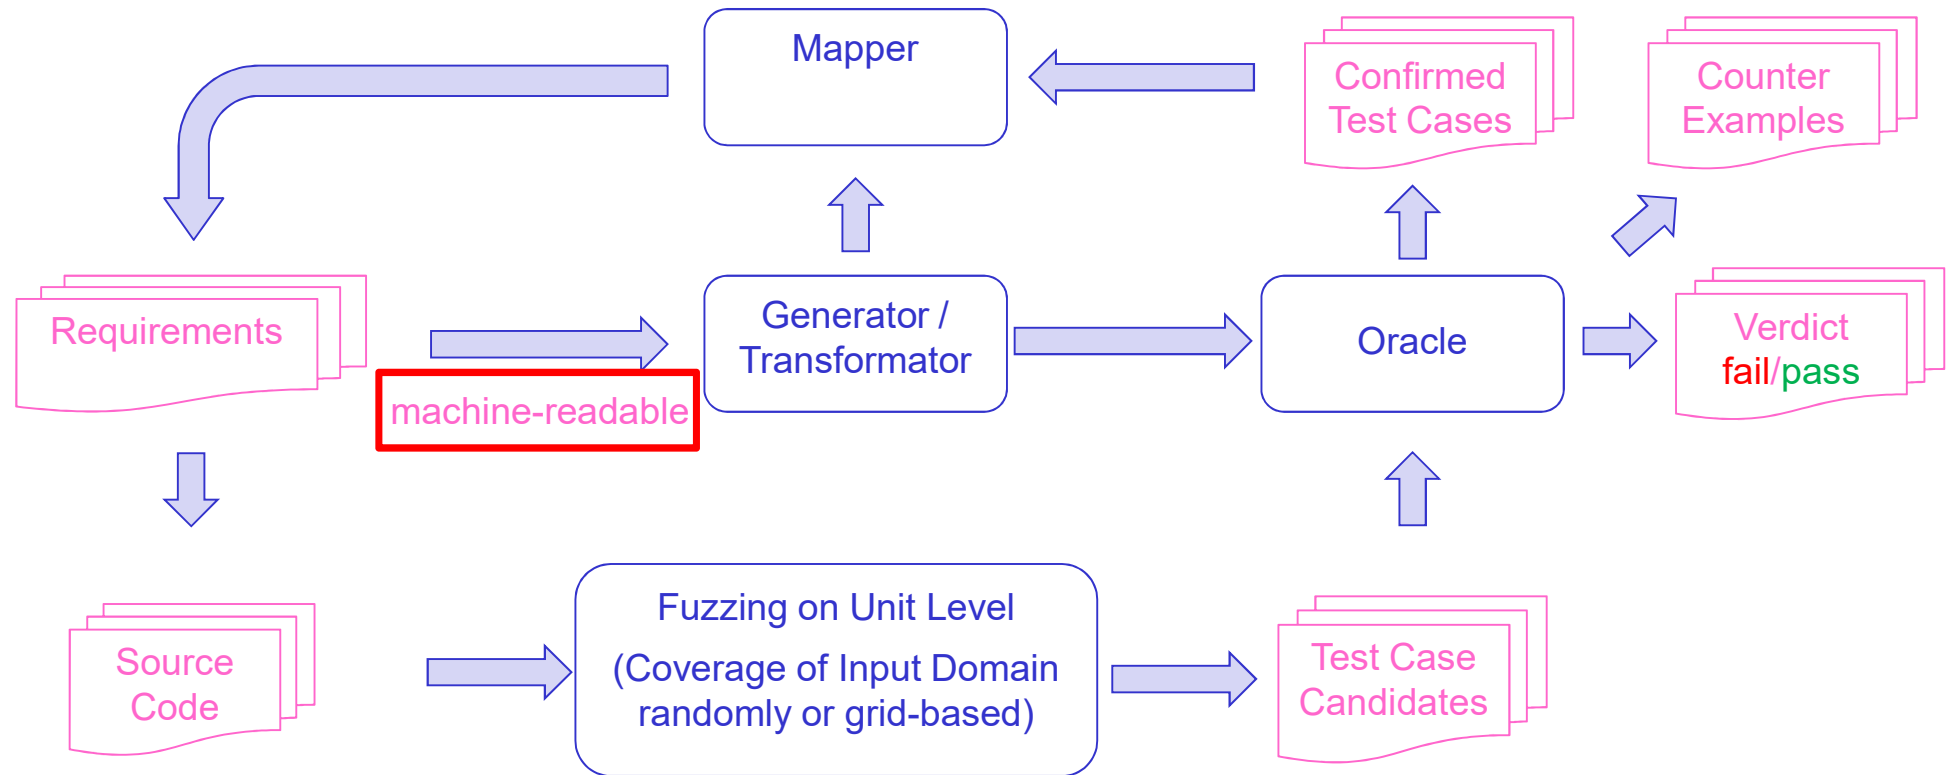

# Oracles vs. Requirements and pass / fail Inheritance

Requirements Hierarchy

# THE Challenge: machine-readable requirements (an)otation

**Currently:**  
Requirements as pure text (Word, DOORS)  
Automated extraction of oracles is difficult/impractical

**Challenge:**  
Suitable and acceptable notation for requirements / oracles

**Suggestions from users required!**

- The same measures for quality assurance as for the source code to be verified also apply to the oracles.
- This is similar to measures for manual verification.
- In addition, suitable automated checks can be applied in case of automated derivation of oracles.
- In contrast to manual processing the measures are consistently applied for every verification step.
- Improvement in the quality of requirements also expected.

- Oracle notation defined
- Implementation available for integration of oracles with fuzzing / massive stimulation
- Reporting available with bottom-up propagation of pass/fail results
- Identification of counter examples confirmed
- Support for identification of source of failing oracles

- Identification of user-acceptable machine-readable notations
- Analysis of current requirements
- Classification of requirements
  - top-level / low-level
  - functional
  - non-functional
  - quantifiable
- Proof-of-concept

# Acknowledgement

The presented approach is an outcome of the ESA-project “Automated Source-code-based Testing, Continued” (FAST II) for the European Space Agency (ESA) (ESA Contract No. 4000116014) as part of the General Support Technology Programme (GSTP).

Funded by the German Ministry of Economics and Energy (Bundesministeriums für Wirtschaft und Energie, BMWi) and initiated by the German Space Agency (DLR Raumfahrtmanagement).
